ABSTRACT OF THE DISCLOSURE

A method and system for the collection of unique and individualized data, herein called content, via the Internet and storing that content. The method and system also provides for the ordering, display and printing of that content itself or in combination with other data which may be less unique but still individualized to produce a multiplicity of items each of which retains a unique character. This is in contrast to any conventional system that provides for the printing of personalized items, while unique to the order, are not individually unique but instead are identical replicas. The system is comprised of a client system operated by the user and a server system which supplies forms to the client system to collect the content, forms to edit the content, forms and methods to combine or manipulate the content with other content, and methods for the user to preview the content or combined content and to print the content on printable items either at the physical location of either the server system or the client system.
